I'm genuinely excited about what Clipboard is building. As someone who started college pre-med, I've stayed connected to healthcare through friends and family who are nurses, techs, and doctors dealing with brutal schedules at understaffed facilities. Watching them burn out while knowing there are qualified professionals who want more flexible work has been really frustrating.

What's awesome about Clipboard is you're actually solving this with technology that works. I've been building platforms that help teams move faster, like cutting data integration time from weeks to 3 days, and I love the idea of applying that same approach to infrastructure that directly helps my nurse friends pick up shifts when they want them and helps facilities get the staffing they desperately need.

I'm excited about the technical challenges too. Building self-service tooling for product teams, scaling infrastructure for millions of shifts, optimizing costs with smart architecture. The fact that this engineering work directly addresses a problem I've watched affect people I care about makes it way more meaningful than just building another platform.

I'd love to talk more about how my platform engineering experience could help Clipboard scale and keep making healthcare work better for everyone involved.

Best regards,

Alphonso Woodbury
